GATE Electronic & Communication Engineering Study Material

Skin effect is the tendency of an alternating electric current (AC) to become distributed within a conductor such that the current density is largest near the surface of the conductor, and decreases with greater depths in the conductor. The electric current flows mainly at the "skin" of the conductor, between the outer surface and a level called the skin depth.

Skin effect - Wikipedia

Electromagnetic induction was discovered by Michael Faraday, published in 1831. It was discovered independently by Joseph Henry in 1832.. In Faraday's first experimental demonstration (August 29, 1831), he wrapped two wires around opposite sides of an iron ring or "torus" (an arrangement similar to a modern toroidal transformer).[citation needed] Based on his understanding of electromagnets ...

Electromagnetic induction - Wikipedia

Electrical resistance) is a property of a material that opposes the flow of electric current. It is measured in ohms (Ω). The resistance of a material depends on its length, cross-sectional area, and resistivity. The resistivity of a material is a property that depends on the material's composition and temperature. The resistance of a material is directly proportional to its length and inversely proportional to its cross-sectional area. The resistivity of a material is directly proportional to its temperature and inversely proportional to its length.

Electromagnetic induction - Wikipedia

Electromagnetic induction is the process of generating an electric current in a conductor by changing the magnetic flux through the conductor. It is a fundamental principle of electromagnetism and is used in many applications, including power generation, transformers, and electric motors.
