Thunder Tiger TTRobotix ROBOHERO - Voice Control

Motion planning (also known as the navigation problem or the piano mover's problem) is a term used in robotics for the process of breaking down a desired movement task into discrete motions that satisfy movement constraints and possibly optimize some aspect of the movement.. For example, consider navigating a mobile robot inside a building to a distant waypoint.

Robot locomotion is the collective name for the various methods that robots use to transport themselves from place to place.. Wheeled robots are typically quite energy efficient and simple to control. However, other forms of locomotion may be more appropriate for a number of reasons, for example traversing rough terrain, as well as moving and interacting in human environments.
